Maple Quick Start

Introduction

In this introductory course, you will become familiar with and comfortable in the Maple environment. You will learn how to use context menus, task assistants, and palettes to perform powerful analyses and create high-impact graphics with only a minimal knowledge of commands. You will also learn how to create technical reports that capture the knowledge behind an analysis directly in the Maple document. This course will give you the tools you need to get started quickly, and a solid foundation upon which to build your future Maple explorations.

To try this material on your own, start with an empty Maple document. Perform the steps found in the left column of each table below. The results of each step are displayed in the right column for your reference.

Note for non-Windows or international users: The keystrokes given in this document are for Windows using a QWERTY keyboard. If you are using a different platform or keyboard, see Help> Quick Help for the list of the most common keystrokes or the <u>2-D math shortcut keys</u> help page.

Talking to Maple

In this section, you will learn the basics of asking Maple a question and getting a result.

Steps	Results
Using [ENTER]	
When you launch Maple you start with a blank document, with menus and toolbars at the top, palettes on the side. At the cursor, you can start typing math. Press [ENTER] to see the result.	1+2 3 (2.1)
Example: Type "1+2 [ENTER]".	
Notice that the result appears on the next line.	

x + 5 - 2 = x + 3
$x + 5 - 2 = x + 3 \xrightarrow{\text{integrate w.r.t. } x} \frac{1}{2} x^2 + 3 x$
$x + 5 - 2 = x + 3 \xrightarrow{\text{integrate w.r.t. } x} \frac{1}{2} x^2 + 3 x$ \rightarrow
80 70 60 50 40 30
-10 -5 0 5 10

Tip: Clicking on the "execute all" button, **III**, recalculates the entire document.

Entering Math

There are a number of methods to enter math into Maple. You can enter math using a combination of palettes, keyboard shortcuts, context menus and commands. Most operations can be entered in more than one way, so you can pick the method you are most comfortable with.

Steps	Results

Exact Answers and Numeric Approximations	
Maple calculates exact answers (i.e. fractions remain as fractions).	$\frac{1}{2} + \frac{1}{3} = \frac{5}{6}$
Example: On a new line, enter $1/2 + 1/3$.	$\frac{1}{2} + \frac{1}{3} = \frac{5}{6} \xrightarrow{\text{at 5 digits}} 0.83333$
Note that the / automatically moves you to the denominator. The right-arrow will take you out. Press [Alt][ENTER] to see the result on the same line.	$0.5 x + \frac{1}{3}x = 0.8333333333 x$
Maple also calculates numeric approximations.	$0.5 x + \frac{1}{3}x = 8.33 \times 10^{-1} x$
Example: Right-click the above result and select Approximate from the context menu. Select accuracy of 5 digits.	
If your problem uses decimal approximations already, Maple will return the answer in the same format.	
Example: Try the example on the right.	
You can apply different formatting to numeric results.	
Example: Right-click the above result and select Numeric Formatting from the context menu. Select Scientific, then press Apply Formatting.	

Palettes

Maple has over 1000 palette symbols within the <u>palette menus</u>. You can also use Maple's expression palette to input expressions. The expression palette contains fill-in-the-blank templates for common operations.

Example: Use the Expression Palette, find the integral of $4 \cdot t^6 + \sin(t) dt$. Open the expression palette (click on **Expression** on the left-hand side of your Maple document) and click the indefinite integral button. An indefinite integral template will appear in your worksheet. Fill in the place-holders (use [TAB] to move to the next placeholder). When done, press [ENTER] to evaluate.

Note: Use ^ to create a superscript, and right-arrow to get out again.

Example: Use the expression palette to find the limit of a function.

Tip: Put frequently used palette entries on the Favorites Palette. Right-click on the palette button and select **Add to Favorites Palette.**

Tip: Maple has many different palettes for entering expressions. To see all of the available palettes, right-click on the palette dock and select **Arrange Palettes**.

$$4 \cdot t^{6} + \sin(t) dt$$

 $\frac{4}{7} t^{7} - \cos(t)$ (3.1)

$$\lim_{x \to 0} \frac{\sin(x^2)}{x} = 0$$

Symbol Completion			
The symbol completion mechanism provides an alternative to palettes for entering symbols.	$\pi^2 + \sqrt{x}$	$\pi^2 + \sqrt{x}$	(3.2)
Type the first few characters of the symbol name, and press [Ctrl][Space] . Choose the symbol you want from the list.			
Example: Try entering $\pi^2 + \sqrt{x}$. To enter π , type pi [Ctrl][Space]. For x , enter sqrt [Ctrl][Space].			
Case-Sensitivity			
Maple is case-sensitive.	$\begin{aligned} x + x &= 2 x \\ y + Y &= y + 2 \end{aligned}$	Ŷ	
Example: Enter " $x + x$ ". Example: Enter " $y + Y$ ". Compare the results.			

Implicit Multiplication		
Maple understands implicit multiplication.	3 x + 5 x = 8 x	
Example: Type " 3 x " for "3 times x".		
To multiply two variables, use a space. " x y " means "x times y", but " xy " means the variable whose name is "xy".	x y + xy = x y + xy	
Example: Type "x [space] y + xy ". If you choose to Differentiate using the context menu, you will see that x, y, and xy are treated as three separate variables due to the way they were entered.	f(x+1) = f(x+1)	
You should be careful using implicit multiplication in Maple to avoid confusion with function calls. To us, $f(x + 1)$ looks like a function call, and $x(x + 1)$ looks like implied multiplication. Maple understands both of these as function calls.	$\frac{x(x+2)}{x} = \frac{x(x+2)}{x}$ $\frac{x(x+2)}{x} = x+2$ $\frac{x \cdot (x+2)}{x} = x+2$	
Example: Enter $\frac{x(x+2)}{x}$ using no space, a space, and an explicit multiplication sign. Ask Maple to calculate each result so you can see the differences.	(x+y) (a+b) = (x+y) (a+b)	
When multiplying with brackets you can use a space to achieve implicit multiplication, but it is usually safest to explicitly use the multiplication symbol.		
Maple also automatically inserts a space Maple Quic	k Start	9

Mathematical Notation	solve DE
Maple understands familiar mathematical notation.	$y'' + y' + y = 0 \xrightarrow{2 + 2 + 2}$ $y(x) = C1 e^{-\frac{1}{2}x} \sin\left(\frac{1}{2}\sqrt{3}x\right)$
For example, Maple understands that $y'' + y' + y = 0$ is a differential equation in $y(x)$.	$+ C2 e^{-\frac{1}{2}x} \cos\left(\frac{1}{2}\sqrt{3}x\right)$
Example: Enter the equation listed above (using the single quote key for the prime notation). To verify that it is in fact a differential equation, select Solve DE from the context menu.	
Label References	
Maple uses label references.	(3.2)·x
Whenever you use [ENTER] to get a response, the result is automatically given a label reference. To refer to a previous result in a computation, use [Ctrl]+[L] and enter the label reference number.	$\left(\pi^2 + \sqrt{x}\right) x \tag{3.3}$
Example: Multiply the result $\pi^2 + \sqrt{x}$ (from above) by x, using labels.	
To reference an equation from another document, use Insert > Reference	

Variable Assignment	costA := 5 x	
In order to assign a value to a variable name, the colon-equals operator is used.	5 x $costA$ $5 x$ $costB := 4 x$	(3.4) (3.5)
Example: To assign the value "5*x" to the variable name "costA", the assignment statement , := (colon equals) is used. After a value has been assigned to "costA", it can be used in subsequent calculations.	4x $costA + costB$ $9x$	(3.6) (3.7)
Note : Anything you want Maple to evaluate (e.g assignment statements), must be entered in Math mode. Anything entered in Text mode will be non- executable.		

Tip: Find the list of keyboard shortcuts for your platform. Click **Help > Quick Help** menu, and select **Math Editor Shortcuts.**

Combining Text and Math

In Maple you can combine math and text in the same paragraph to help formulate mathematical sentences.

Steps	Results
<i>Example:</i> Start by entering a simple computation.	$\int x^3 + x^2 + 3 \mathrm{d}x = \frac{1}{4} x^4 + \frac{1}{3} x^3 + 3 x$
Go back to the start of your computation (place the cursor to the left of your expression), press [F5] to change from math input to text input, and start typing text.	The integral $\int x^3 + x^2 + 3 dx =$ $\frac{1}{4} x^4 + \frac{1}{3} x^3 + 3 x$
You can also input text in place of the equals sign (=). Click on the equals sign and replace it with some additional text.	The integral $\int x^3 + x^2 + 3 dx$ is equal to $\frac{1}{4} x^4 + \frac{1}{3} x^3 + 3 x$
Place your cursor at the end of the output, press [F5] , and complete the rest of the sentence.	The integral $\int x^3 + x^2 + 3 dx$ is equal to $\frac{1}{4}x^4 + \frac{1}{3}x^3 + 3x$, as you can plainly see.
Modify some of the terms in the problem, highlight the entire sentence and press the button to re-execute the computation.	The integral $\int x^3 + 5x^2 + x + 3 dx$ is equal to $\frac{1}{4}x^4 + \frac{5}{3}x^3 + \frac{1}{2}x^2 + 3x$, as you can plainly see.

Tip: Pressing **[F5]** allows you to easily toggle between math input and text input.

Tip: In math mode, the cursor is slanted and has a dotted box around it. In text mode, the cursor appears as a vertical bar.

can also use these buttons to change modes as an alternative to pressing [F5].

Plotting

Maple can produce 2-D and 3-D plots of equations and expressions.

Steps	Results
-------	---------

2-D Plots

Now we will demonstrate plotting in Maple. The fastest way to plot an expression in Maple is to use the context menu.

Example: Enter an expression in x (e.g. $\sin^2(x)$), right-click on the expression, and select **Plots > 2-D Plot.**

Example: Use the point probe to find the coordinates of different points in the graph. To turn on the point probe, right-click on the plot and choose Nearest point on line.

Example: To pan the plot, right-click on the plot, and select **Manipulator>Pan**. Hold down the left mouse button and use the mouse to move the plot around. To scale the plot, perform the same steps, but select **Manipulator>Scale**.

Tip: You can also change the manipulator tool by clicking on the plot, and then selecting the appropriate tool from plot toolbar at the top of the Maple window:

The enhanced point probe tool can find the point on the curve closest to your cursor, and allows you the ability to extract the coordinates of the cursor and paste them anywhere in the document.

3-D Plots

Example: Enter an expression in x and y (e.g. $sin(x) \cdot y$). Right-click on the expression and use **Plots** > **3-D Plots** > **x,y** from the context menu.

Example: Rotate the plot by clicking on the plot, holding down the left mouse button and moving the mouse.

Example: Pan and scale the plot by selecting a different tool from the **Manipulator** list on the context menu. Now when you hold down the mouse button and move the mouse, the new action is performed.

Tip: You can also change the manipulator tool by clicking on the plot, and then selecting the appropriate tool at the top

of the Maple window:

Plot Options

You can modify the look of your plot in a variety of ways.

Plot options can be changed by rightclicking on the plot and modifying the options within the contest menu. Note that the choices available in the context menu are specific to 3-D plots.

Example: Right-click on the plot to obtain the context menu. Click **Transparency** and modify the plot transparency.

Plot options can also be changed by clicking on the plot, selecting the Plot toolbar at the top of your Maple worksheet, and selecting the relevant options.

Example: Click on the image, from the toolbar select **Plot > Axes > Boxed**.

Task Assistants, Tutors and Math Apps

As explored above, context menus are one way to solve problems without using Maple commands. Task assistants provide another method. Tutors are useful for teaching and exploring mathematical concepts. The full list of assistants and tutors can be found on the **Tools** menu.

Steps	Results
Using the Plot Builder Assistant	$x^2 + y^2 \rightarrow$ My Plot
Plots can easily be created in Maple using the builtin Plot Builder.	50 40 30 20
Example: Enter the expression you want to plot. From the context menu, select Plots > Plot Builder . Using the Plot Builder, you can choose the kind of plot you want, add titles, and set options, all at once. This example shows a 3-D plot with the use of plot title, normal axes and style of surface with contours.	

The **Exploration Assistant** allows you to instantly create interactive miniapplications used to <u>explore</u> the parameters of the expressions

Example: Enter the expression you want to explore. Select **Explore** from the context menu. In the submenu, input the parameters you would like to test. If you do not want to explore a variable, check the box next to skip.

With the given expression, choose to skip \boldsymbol{x} and \boldsymbol{y} .

Explore generates an user interface with interactive sliders, dials or gauges that can vary the values for the parameters and show the results. $plot3d(\cos(a x) + b \sin(y))$

Math Apps	Drum Vibrations
Math Apps and other interactive applications provide demonstrations that illustrate various mathematical and scientific concepts. The MathApp Guide provides an overview of all of the available applications in many different fields including Discrete Math, Engineering, Finance, Statistics, and more.	
<i>Example:</i> From the menu, select Tools > MathApps To open a MathApp, simply click on its icon.	

Tip: You can also view Math Apps online using the online <u>Maple Cloud</u>.

Entering Commands

While many operations in Maple can be done through the use of context menus and other interactive tools, Maple also has a rich programming language.

Steps	Results

Entering Maple Commands		
Many commands are grouped together in packages. You can type the long name, or enter a with() command prior to using a command from that particular package.	$M \coloneqq \begin{bmatrix} 1 & 2 \\ 3 & 5 \end{bmatrix}$ $\begin{bmatrix} 1 & 2 \\ 3 & 5 \end{bmatrix}$	(7.1)
Example: Create a Matrix, M, and apply the command <i>LinearAlgebra</i> [<i>Determinant</i>](<i>M</i>) to find the determinant of M.	LinearAlgebra[Determinant](M) -1 Determinant(M)	(7.2)
Note: If you do not provide the package name, Maple does not know the definition of this function, and so simply returns the unevaluated expression.	$Determinant \left(\begin{bmatrix} 1 & 2 \\ 3 & 5 \end{bmatrix} \right)$ $with(LinearAlgebra):$	(7.3)
You can avoid having to type the long- form of each command by pre-loading the desired package. You can use a colon at the end of the command to suppress output.	$Determinant(M) -1$ $GaussianElimination(M)$ $\begin{bmatrix} 1 & 2 \end{bmatrix}$	(7.4)
Example: Load the <u>LinearAlgebra</u> package first using a colon. Try again without the colon to see the difference.	0 -1	(7.5)
Example: Now calculate the <u>Determinant</u> of M using the short-form of the command.		
Command completion is very useful when typing out long command names.		
Example: Type Gau, then press [Ctrl]+ [Space] to see a list of possible completions. Use the arrow key to select Maple Quic	k Start	25

Document Editing and Formatting Tools

Maple contains numerous word processing tools to help you create professional-looking reports. For your reference, here is a list of some of the more common ones.

Feature	Where to Find It
Built-in title and headings styles	Drop-down list on toolbar
Sections and subsections	Insert > Section, Insert > Subsection
Tables	Insert > Table
Ability to edit table properties	Right-click anywhere in the table, then select Table>
Drawing canvas	Insert > Canvas
Font control and ability to define new styles	Toolbar buttons, Format > Styles
Ability to insert images, spreadsheets and other objects	Insert > Image, Insert > Object
A spell-checker aware of mathematical terms	Tools > Spellcheck
Hyperlinks and bookmarks	Format > Convert to > Hyperlink Format > Bookmarks
Ability to add headers and footers	View>Header Footer
Export to HTML, PDF, etc.	File > Export As

Tip: The user manual contains a chapter on creating mathematical documents.

Configuring the Maple Environment

You can customize the Maple environment in many ways. Below is a list of the most common ones. Note that any option set through the **Options** menu can be set just for

this session, or globally (every time you start Maple).

Feature	How to Control Feature
Start-up dialog	Turn it off by clearing the check box on the dialog.
	Turn it on again through Tools > Options, Interface tab.
	See it anytime by Help > Startup Dialog
Quick Help displayed on new documents	Turn it off by clearing the check box on the quick help.
	Turn it on again through Tools > Options, Interface tab.
	See it anytime by pressing [F1].
Option for new documents to start in Document mode (no prompt, context menu commands hidden) or Worksheet mode (prompts, all commands shown).	Tools > Options, Interface tab Default format for new worksheets
Option to enter math in 2-D (default) or 1- D	Tools > Options, Display tab
(Note: Choice only available in worksheet mode. All math must be entered in 2-D in document mode.)	x^2 vs. x^2
You can also control the input type for individual lines, without changing the overall default.	Use context menu on the line above. Selecting Convert to > 2-D Math Input turns the above line into x^2

Number of digits displayed in calculation results. Maple displays 10 digits by default (though it calculates with more).	Tools > Options, Precision tab Round screen display to For example, show the floating point value of π . The default result is: $evalf(\pi)$	
	3.141592654 (9.1)	
	After setting the screen display to 5, the result is:	
	$evalf(\pi)$	
	3.141592654 (9.2)	
Add item to Favorites Palette.	Right-click on palette button, Add to Favorites Palette	
Palettes can be reordered, and individual palettes can be moved from one dock to the other, or turned off completely.	View > Palettes > Arrange Palettes	
Palette docks can also be expanded and collapsed.	Use the View> Palettes menu, or the small arrows at the top of the palette to expand and collapse. For the left-hand-side dock, these arrows are in the top-right corner of the palette, to the right of the scroll bar.
